

PolyFirm CPx Hand Applicator

Create your own Hand Applicator for CPx trail application.

Start with a simple plastic Watering can available for a few dollars at any home supply or garden store like Home Depot.

The holes are too small for the viscous mixture, so they will need to be drilled out.

Enlarge holes with an approximately 1/8" drill bit.

Finished product will look something like this sample.

This unit will allow you to easily POUR the mixture on to the gravel material.

Great for small jobs, and for edges, joins and touch-up on larger jobs.

Make a two or more units for a team.

Applicator can then be easily filled using a wide-mouth fill spout available at auto-supply stores for under \$2.

At the standard warm-weather dilution rate, this two gallon applicator would take 2 gallons of water plus 1 quart of CPx resin. This should treat a 4x4 foot area at 2" depth.
